

## GAS5LOC31

### SFP 155M 1310nm 40Km LC

#### Features

- Duplex LC receptacle optical interface
- Single +3.3V power supply
- Hot-pluggable
- AC coupling of PECL signals
- Serial ID module on MOD (0-2)
- DDM Function implemented
- External Calibration
- International Class 1 laser safety certified
- Transmitter disable input
- Receiver Loss of Signal Output
- Operating temperature range: -0°C~+70°C
- Compliant with RoHS

#### Applications

- SDH/ STM-1, SONET/OC-3
- Metropolitan area network
- Fast Ethernet
- Other optic link

#### Standards

- Compliant with SFP MSA (INF-8074i)
- Compliant with ITU-T G.957 STM-1
- Compliant with SFF-8472 v9.3

**Note:**

- The supply current includes SFP module's supply current and test board working current.
- For the jitter measurements, the device was driven with SONET OC-3 data pattern with 2<sup>23</sup>-1 PRBS payload..
- RIN is the laser noise, integrated over a specified bandwidth, measured relative to average optical power with 12dB return loss.
- Measured with a PRBS 2<sup>23</sup>-1 test pattern, @155Mb/s, EX=10dB, BER<10<sup>-10</sup>.
- The LOS Hysteresis to minimize "chatter" on the output line. In principle, Hysteresis alone does not guarantee chatter-free operation

The measured values located at bytes 96-105 (in the 2 wire address 0xA2) are raw A/D values (16-bit integers) of transceiver temperature, supply voltage, laser bias current, laser optical output power and received power. All the measured values are “Externally Calibrated”, and then it is necessary to convert raw A/D values to real world units by the manner as shown in Table 3.1.

**Table 3.1 Real Time Diagnostic Monitor Values**

Byte	Name	Description
97	Temperature LSB	Internally measured supply voltage. Comply with External Calibration of SFF-8472.
98	Vcc MSB	
99	Vcc LSB	
100	Laser Bias MSB	Measured Laser bias current. Comply with External Calibration of SFF-8472.
101	Laser Bias LSB	
102	Tx Power MSB	Measured Tx power. Comply with External Calibration of SFF-8472.
103	Tx Power LSB	
104	Rx Power MSB	Measured Rx power. Comply with External Calibration of SFF-8472.
105	Rx Power LSB	

This transceiver implements two optional status bytes, “Logic States” at byte 110(0xA2)” and “A/D Updated” at byte 111(0xA2) as shown in Table 3.2. “A/D Updated” status bits allow the user to verify if an update from the analog-digital conversion has occurred of the measured values, temperature, Vcc, laser bias, Tx power and Rx power. The user writes the byte to 0x00. Once a conversion is completed for a given value, its bit will change to ‘1’.

**Table 3.2 Logic Status and AD Conversion Updates**

Byte	Bit	Name	Description
110	7	Tx Disable State	Optional digital State of the Tx Disable input pin.
110	6	Soft Tx Disable Control	Not supported (set to 0).
110	5	Reserved	Set to 0.
110	4	Rx Rate Select State	Not supported (set to 1).
110	3	Soft Rate Select Control	Not supported (set to 0).
110	2	Tx Fault	Optional digital state of the Tx Fault output pin.
110	1	LOS	Optional digital state of the LOS output pin.
110	0	Power on Logic	Bit will be 0 when the analog monitoring is active.
111	7	Temp A/D Valid	Indicates A/D value in Bytes 96/97 is valid.
111	6	Vcc A/D Valid	Indicates A/D value in Bytes 98/99 is valid.
111	5	Laser Bias A/D Valid	Indicates A/D value in Bytes 100/101 is valid.
111	4	Tx Power A/D Valid	Indicates A/D value in Bytes 102/103 is valid.
111	3	Rx Power A/D Valid	Indicates A/D value in Bytes 104/105 is valid.
111	2	Reserved	Set to 0.
111	1	Reserved	Set to 0.
111	0	Reserved	Set to 0.

Each of the measured values has a corresponding high alarm, low alarm, high warning and low warning threshold level at location 00-39(x0A2) written as the data format of a corresponding valued shown in Table 3.3 Alarm and warning flags at bytes 112-119(0xA2) are defined as follows.

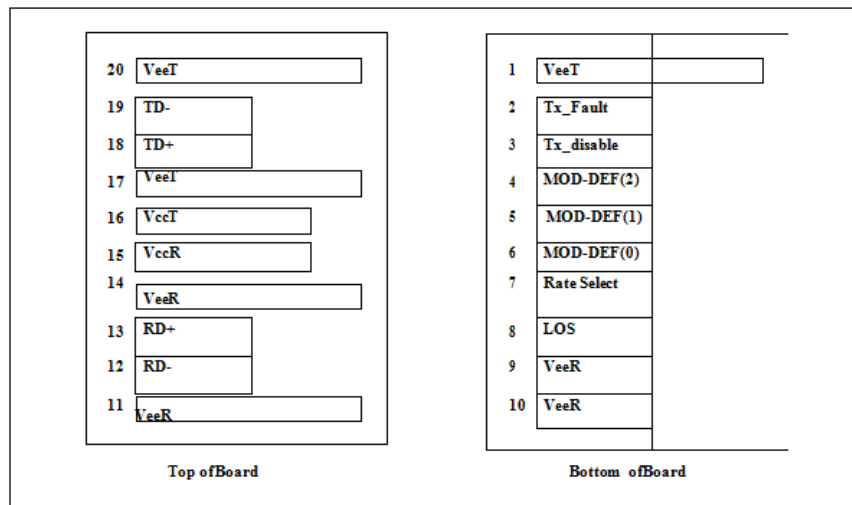

- (1) Alarm flags indicate conditions likely to result (or have resulted) in link failure and cause for immediate action.
- (2) Warning flags indicate conditions outside the guaranteed operating specification of transceiver but not necessarily causes of immediate link failures.

**Table 3.3 Alarm and Warning Flags**

**Note1.** TX Fault is open collector/drain output which should be pulled up externally with a 4.7K – 10KΩ resistor on the host board to supply <VccT+0.3V or VccR+0.3V. When high, this output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to <0.8V.

**Note2.** TX Disable input is used to shut down the laser output per the state table below. It is pulled up within the module with a 4.7 – 10K resistor.

Low (0 – 0.8V): Transmitter on Between (0.8V and 2V): Undefined  
 High (2.0 – VccT): Transmitter Disabled Open : Transmitter Disabled

**Note3.** Mod-Def 0, 1, 2. These are the module definition pins. They should be pulled up with a 4.7 - 10K resistor on the host board to supply less than VccT+0.3V or VccR+0.3V.

Mod-Def 0 is grounded by the module to indicate that the module is present. Mod-Def 1 is clock line of two wire serial interface for optional serial ID. Mod-Def 2 is data line of two wire serial interface for optional serial ID.

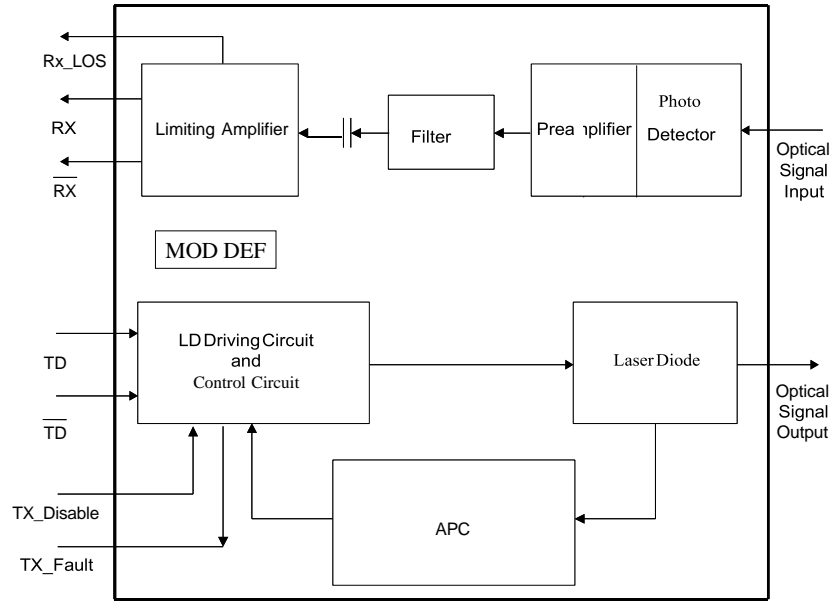

**Note4.** LOS (Loss of signal) is an open collector/drain output which should be pulled up externally with a 4.7 – 10K resistor on the host board to supply <VccT+0.3V or VccR+0.3V. When high, this output indicates the received optical power is below the worst case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to <0.8V.

**Note5.** RD-/+ : These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω differential at the user SERDES. The AC coupling is done inside the module and thus not required on the host board.

**Note6.** VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V±5% at the SFP connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.

**Note7.** TD-/+ : These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.

**Block Diagram**

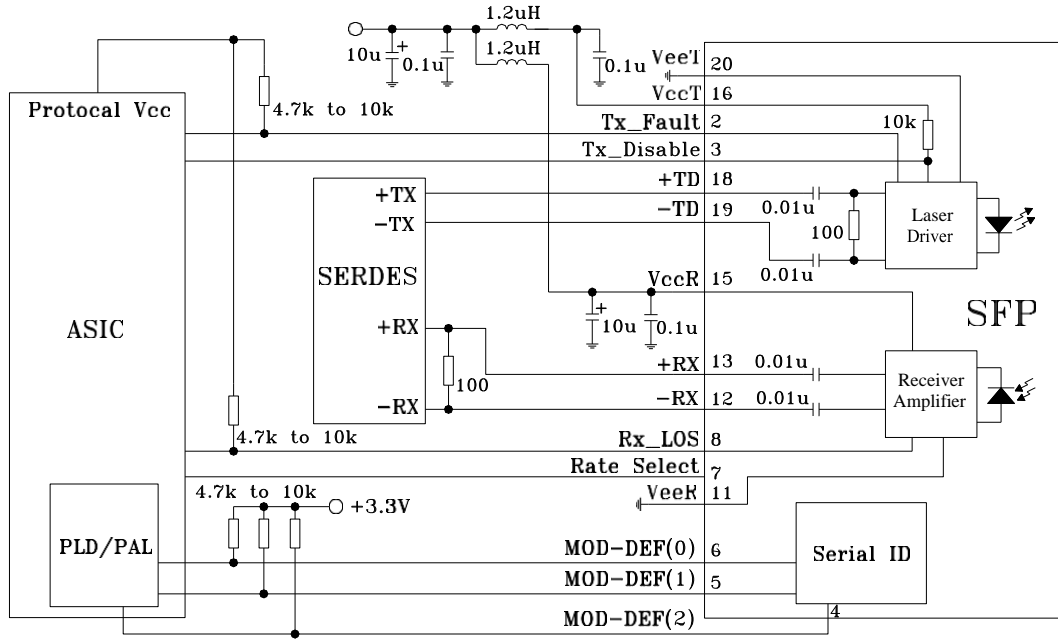

### Required Host Board Components

The MSA power supply noise rejection filter is required on the host PCB to meet data sheet performance. The MSA filter incorporates an inductor which should be rated 400mADC and 1Ω serial resistance or better. It should not be replaced with a ferrite. The required filter is illustrated in Figure 3. The MSA also specifies that 4.7K to 10KΩ pull-up resistors for TX\_FAULT, LOS, and MOD\_DEF0,1,2 are required on the host PCB. Figure is the suggested transceiver/host interface.
